

Helping students experience career options by building a vocational program at Plymouth High School

CompressAir is excited to have had this opportunity to help give students the chance to experience different types of career choices.

With the help of other companies in the community, Plymouth High School arranged a vocational program for students that are interested in a machine shop career path. This classroom was designed to hold up to 24 students. The vocational program is geared towards a two year program where students can earn up to four certifications. Thus far, many students have been hired for after graduation by machine shops around the community.

CompressAir and Sullair partnered to donate a Sullair 1800VS air compressor, RN 125, and a filter. Installations and infinity pipe work was performed by CompressAir's technicians.
